The Fink GmbH seal of quality promises that this magazine is printed exclusively with materials and machines from Germany for ecological and economic reasons.

Comtex 4G for mail order and e-commerce:

Fully automated despatch and returns packaging line The new generation of fully automatic packaging machinery

The BVM „**Comtex 4G Active**“ packaging system is a fully automatic solution for bagging products in a wide variety of sizes, without the need for adjustment.

The BVM returns system „**Comtex 3G Returns**“, allows returned items to be re packaged cost-effectively. Items are processed and put back into stock in their „original packaging“ which will save time, material costs and space.

The BVM „**Comtex 4G Despatch**“ is a complete outbound shipping system for the e-commerce industry, the goods are wrapped in PE film bags for dispatching directly to the customer.

The **Comtex 4G** side sealer, operates fully automatically in line, and can process products that do not have to be pre-sorted and may vary in size. With additional integration options the system can provide full data management, in turn producing automated insertion of documents and applying a despatch label. These machines can meet the budgets and requirements of various sized companies, whilst providing a rapid pay-back on capital investment.

These systems reduce the need for consumable storage space, costly packing stations and void filling material. The shipping label offers the possibility to map individual client data as well as different carrier information.

Transparent film is used for returns packaging and opaque, colored, or printed recyclable PE film is used for shipping packaging.

Many of the world's leading e-commerce companies have already embraced this technology.
